To Do List HW

My site does not have a target age, but I believe it would appeal better to the younger generation.

While designing the site, I thought about somethings I would like in a to do list and added them. Such as, when you hover over an item in the list it changes a different color as well as when you click the item. When making the website I referred back to Schneiderman's eight heuristics for interface design. I considered number 3 which was offer informative feedback. The way I implemented this was when the user forgets to type something in the list box, a error screen will pop up on the screen that says "you must type something". I find the color scheme particularly appealing, although my interface isn't really much. I feel like there is honestly a lot I can improve on in my site, such as the check boxes, and actually being able to delete a task(as of now you can only cross the task out or have to refresh the page). Not only that but I felt like I could have designed it better, if I had more experience using HTML, CSS and JavaScript. I believe I may possibly have a hidden affordance, which is the check boxes. I don't think if a user was to use my site they would know that the little white box is a check box. In addition a constraint on my interface would be that a user won't really know how to delete a task because there is no option, so they would have to refresh the site to do so, while at the same time losing the data they previously typed.

Tasks done: A & B
